

An Unmistakable Warming Trend

IT'S NOT THE SUN

Upper levels of the atmosphere are cooling, which is what would happen if climate change is man-made.

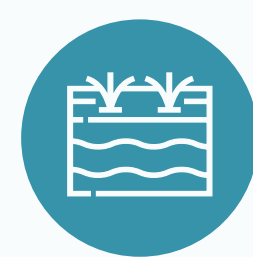

SNOW & ICE ARE VANISHING

Snow and glaciers are shrinking. Arctic sea ice hit its lowest extent on record in 2012.

TEMPERATURE IS INCREASING

Thermometers and satellites show that temperature is increasing in rural and urban areas and over oceans.

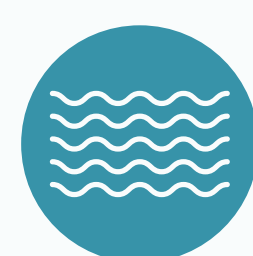

PERMAFROST IS MELTING

Permafrost is melting rapidly, causing infrastructure damage and releasing more greenhouse gas.

EXTREME WEATHER INCREASE

Weather extremes are on the rise and last longer.

SEA LEVEL IS RISING

After 2,000 years of little change, global sea level began to rise in the 20th century.

DROUGHT & WILDFIRES

Extended periods of dry, hot weather are increasing drought and wildfires.

ECOSYSTEMS ARE CHANGING

Plant life-cycles are changing, and the migration patterns of animals are being impacted.
